It is important to note that in comparison to adult stem cell research, embryonic stem cell research is still in its infancy, and its potential should be understood in this context. Human embryonic stem cell studies are in early stages, and are currently being used to help understand the differentiation and functions of many human tissues, including neural, cardiac, vascular, pancreatic, hepatic, and bone. Embryonic stem cells have two properties that make them promising for research and cell therapy. First, they can be grown in tissue culture, and therefore provide an abundant, renewable source of cells. Second, they are pluripotent and can (theoretically) be directed to become virtually any cell type of the adult body. But while much has been postulated about the ability of embryonic stem cells to generate transplantable cells for medical applications, many scientific hurdles remain before they could be used clinically in the United States. One of the difficulties specific to embryonic stem cells is...
